

Introducing **HyperSDK** — Simplifying Multi-Cloud VM Migration

Modern infrastructure shouldn't be this complicated.
Multiple clouds. Different hypervisors. Fragmented tools. Endless manual work.
That's exactly why we built HyperSDK.

<https://hypersdk.cloud/>

💡 What is HyperSDK?

A unified platform to discover, export, convert, and deploy virtual machines across any cloud or hypervisor — all in one place.

⚙️ What it brings to the table

- Multi-cloud VM discovery (VMware, AWS, Azure, more)
- Seamless export (VMDK, QCOW2, RAW, OVA...)
- Automated conversion powered by hyper2kvm
- Direct deployment to KVM / KubeVirt
- Observability + real-time monitoring

🔥 Why it matters

Today's migration tools are fragmented — you stitch together exporters, converters, scripts, and hope nothing breaks. HyperSDK changes that.

- One pipeline
- One platform
- Zero guesswork

🚀 Whether you're

- Exiting VMware
- Moving workloads across clouds
- Modernizing to KubeVirt
- Or building hybrid infra

HyperSDK is built to make it simple, fast, and reliable.

Feedback welcome. What's the hardest part of VM migration in your experience?
